

Def:- Anova is a statistical method used to compare the means of 2 or more groups

Anova (Analysis of Variance)

Anova

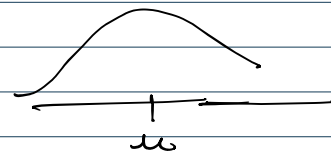

① Factor (variable)

② Levels

Assumption of Anova

① Normality of Sampling distribution of mean

The distribution of sample mean as normaly distribution

② Absence of Outliers

Outlying score need to be removed from the dataset.

× (out) × Mean × ×

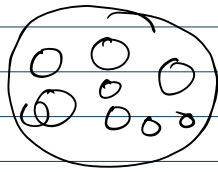

③ Homogeneity of Variance

population variance in different levels of Each Independent variable are equal

$$\sigma_1^2 = \sigma_2^2 = \sigma_3^2$$

④ Samples are Independent and Random

Random Sampling

Random Sampling

→ Types of ANOVA
