

Chi-Square test :-

The Chi-Square test for Goodness of fit test claims about population proportions.

It is non parametric test that is performed on categorical (ordinal & nominal) data

Eg:- There is a population of individuals like different color likes

	Theory	Sample	Goodness of fit test
yellow like	$\frac{1}{3}$	22	
Red like	$\frac{1}{3}$	17	
Blue like	$\frac{1}{3}$	59	
	$\frac{1}{3}$	↳	
	Theory & Observed	Observed	

In a class of 75 students, 11 are left handed. Does this class fit the theory that 12% of people are left handed

	O	E	12% left
Left handed	11	9	$\frac{12}{100} \times 75 = 9$
Right handed	64	66	
	75	75	

Example:-
